**Background:** Chronic foot ulcers are a major cause of morbidity in diabetics with a life-time risk of chronic ulcers on the lower extremities of 25%. Treatment is challenging and estimated 14% have chronic leg ulcers for more than 10 years. Vitamin D deficiency is seen more commonly in diabetic patients with chronic foot ulcers, compared to non-diabetics as well as diabetics without foot ulcer.

**Purpose / Aim of Study:** To assess the efficacy of high-dose compared to low-dose Cholecalciferol vitamin D3 on healing of chronic diabetic foot ulcers.

**Materials and Methods:** We included diabetic patients with one or more ulcers of the foot for more than 6 weeks. Patients were randomly allocated to either a daily oral intake of high-dose (170 µg) or low-dose (20 µg) Cholecalciferol vitamin D3. Patients were seen in the outpatient clinic after 4, 12, 24, 36 and 48 weeks. At each visit, the ulcer was measured with a validated camera and the area (cm2) was calculated. Patients and assessors were blinded to treatment allocation. All patients were followed for 48 weeks or until wound healing or surgical treatment.

**Findings / Results:** 64 ulcers in 48 patients (24 in each group) were included in the analysis. 41 ulcers were followed until healing or 48-week follow-up and 20 ulcers were surgically treated during the study period. Three patients were lost to follow-up. The intention-to-treat analysis showed a significantly higher rate of ulcer healing in the high-dose group with 21/30 (70%) compared to 12/34 (35%) healed ulcers in the low-dose group (p = 0.012). Median ulcer reduction at final follow-up was 100% [IQR: 72 to 100] compared to 57% [IQR: −28 to 100.0]. Furthermore, we found a significant effect of high-dose Cholecalciferol vitamin D3 in the repeated measures analysis of variance using square-root-transformed ulcer area as dependent variable (p = 0.014).

**Conclusions:** High-dose Cholecalciferol vitamin D3 is efficient, compared to low-dose Cholecalciferol vitamin D3, in promoting wound healing in diabetic foot ulcers.
